-!- FUNCTION: PROTAMIRES GUBSTITUTES FOR HISTONES IN THE CHROMATIN OF
SPERM DURING THE HAPLOID PHASE OF SPERMATOGENESIS. THEY COMPACT
SPERM DIA INTO A HIGHLY CONDENSED, STABLE AND INACTIVE COMPLEX.
-!- SUBCELLULAR LOCATION: WICLEAR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Retief J.D., Krajewski C., Westerman M., Winkfein R.J., Dixon G.H.; "Molecular phylogeny and evolution of marsupial protamine Pl genes."; Proc.                                                                                                                                                                                                                                                                                                                                            ö
                          This peptide represents a linear derivative of the tachyplesin family of peptide antibiotics. Tachyplesin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the agents to an organism. e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligonucleotides, ribozymes, antitumour agents, antivitals and anti-inflammatories, etc. The derivatives are non-toxic and non-lytic but can cross mammalian cell membranes rapidly by a passive including crossing the blood-brain barrier.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The specification describes a pharmaceutical composition, which comprises at least one anticancer agent associated with at least one peptide that can transport it into cancer cells and which inhibits development of resistance to the anticancer agent. By using the peptide as a vector for delivery of the anticancer agent, machanisms that cause cancer cells to become resistant to the agent, particularly produced by chemical synthesis, can be coupled easily to the agent, cross mammalian cell membranes rapidly by a passive mechanism (no receptors required), and are non-toxic and non-lytic. The compositions are used to treat cancer. The present sequence represents a peptide which may be linked to the anticancer agents of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New composition useful for cancer treatment and prevention, contains anticancer agent and peptide vector that transports agent into cells

Tachyplesin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the agents to an organism. e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligonucleotides, ribozymes, antitumour agents, antivitals and anti-inflammatories, etc. The derivatives are non-toxic and non-lytic but can cross mammalian cell membranes rapidly by a passive including crossing the blood-brain barrier.
                                                                                                                                                                                                      tachyplesin; peptide antibiotic; beta-sheet; secondary structure;

Sequences AAV69610-Y69611 and AAX69617 represent tachyplesin analogues
used in an exemplification of the present invention, in which the
control tachyplesin cysteine residues are replaced with Ala, Leu and
Asp, respectively. Tachyplesin (AAV69608) is a naturally occurring
antimicrobial peptide which contains two disulphide bonds which help
comminist its tertiary structure. The invention relates to novel
peptide analogues of tachyplesin (Y696912-AAX69614, AAX69616) in which
the cysteine residues at positions 3, 7, 12 and 16 of the native
the cysteine replaced by the hydrophobic amino acids isoleucine,
activity methionine, phenylalanine or tyrosine, the same amino acid being
present at all four positions. Despite being unable to form
intramolecular disulphide bonds, the analogues are functional as
antimicrobial agents. The tachyplesin analogues are seful for
controlling fungal and viral activity in agricultural and medical
applications and for controlling plant viruses. They can also be
expressed in transgenic plants, preferably wheat, sorghum, sunflower,
soya or especially maize plants, preferably wheat, sorghum, sunflower,
soya or especially maize plants to provide resistance to pathogenic fungi
                                                                                                                                                                                                                                                                                                 New tachyplesin analogs useful for controlling fungal and bacterial activity in agricultural and medical applications and for controlling plant viruses have four cysteine substitutions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Tachyplesin; inhibitor; antimicrobial; plant pathogen; fungi;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Score 79; DB 21; Length 17;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin (AAR75805) a small peptide isolated from japanese horseshoe crab haemocytes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungi. In particular for fungi pathogenic to plants e.g. Fusarium moniforme, Sclerctinia sclerotiorum, Sclerctinia trifoliorum and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and

This sequence represents a generic tachyplesin (TP) analogue which has antimicrobial activity. Tachyplesin (AAY69608) is a naturally occurring antimicrobial peptide which contains two disulphide bonds which help to maintain its tertiary structure. The invention relates to novel peptide analogues of tachyplesin (Y696912-AAY69614, AAY69616) in which the cysteine residues at positions 3, 7, 12 and 16 of the native tachyplesin are replaced by the hydrophobic amino acids isoleuchne, valine, methionine, phenylalanine or tyrosine, the same amino acid being present at all four positions. Despite being unable to form intramolecular disulphide bonds, the analogues are functional as antimicrobial agents. The tachyplesin analogues are useful for controlling fungal and viral activity in agricultural and medical expressed in transgenic plants, preferably wheat, sorghum, sunflower, soya or especially maize plants, to provide resistance to pathogenic fungi
                                                                                                                  New tachyplesin analogs useful for controlling fungal and bacterial activity in agricultural and medical applications and for controlling plant viruses have four cysteine substitutions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Tachyplesin analogue; generic; antimicrobial; disulphide bond; antifungal; antiviral; antimicrobial; transgenic plant.

                                                                                                                                                                                                                                                                                  AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin (AAR75805) a small peptide isolated from japanese horseshoe crab haemocytes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungi, in particular for fungi pathogenic to plants e.g. Fusarium graminearum, Evarium monificame, Sclerotinia sclerotiorum, Sclerotinia trifoliorum and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and

                                                                                                                                                                                                                                                                                                                    à
                                                                                                                          Sequences AAY69610-Y69611 and AAY69617 represent tachyplesin analogues used in an exemplification of the present invention, in which the native tachyplesin cysteine residues are replaced with Ala, Leu and ASP, respectively. Tachyplesin (AAK69608) is a naturally occurring antimicrobial peptide which contains two disulphide bonds which help to maintain its tertiary structure. The invention relates to novel peptide analogues of tachyplesin (4696912-AAY66614, AAY66616) in which cachyplesin are replaced by the hydrophoic amno acids isoleucine, the cysteine residues at positions 3, 7, 12 and 16 of the native tachyplesin wethlonine, phenylalanine or tyroshobic amno acids isoleucine, valine, methlonine, phenylalanine or tyroshobic amno acid being intramolecular disulphide bonds, the analogues are useful for controlling fungal and viral activity in agricultural and medical applications and for controlling plant viruses. They can also be expressed in transgenic plants, preferably wheat, sorghum, sunflower, soya or especially maize plants to provide resistance to pathogenic fungi and viruses. Note: The present sequence is not shown in the sequence given in column 23.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      <u>;</u>
                           New tachyplesin analogs useful for controlling fungal and bacterial activity in agricultural and medical applications and for controlling plant viruses have four cysteine substitutions

AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin (AAR75805) a small peptide isolated from japanese horseshoe crab haemocytes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungi, in particular for fungi pathogenic to plants e.g. Fusarium graminearum, Fusarium monificame, Sclerotinia sclerotiorum, Sclerotinia trifoliorum and Aspergilus flavus. The peptides can also be used for treating and preventing infection in humans and

AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin (AAR75805) a small peptide isolated from japanese horseshoe crab hosemocytes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungi, in particular for fungi pathogenic to plants e.g. Fusarium graminearum, Fusarium monilforme, Sclerotinia sclerotiorum, sclerotinia trifoliorum and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and animals.
                                                                                                                                                                                                                                                                                             New peptide derivs. of tachyplesin - having antimicrobial activity, used against plant pathogenic fungi or human or animal infections

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin (AAR75805) a small peptide isolated from japanese horseshoe crab hosemocytes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungi, in particular for fungi pathogenic to plants e.g. Fusarium graminearum, Fusarium moniforme, Sclerotinia sclerotiorum, Sclerotinia trifoliorum and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and

The lipopolysaccharide-binding polypeptides may be prepd. by either solid-phase peptide synthesis followed by oxidn. to form the disulphide bridges or, subjecting horseshoe crab haemocytes to hypotonic extraction, extracting the residue with acid, and purifying the extract. The polypeptides have high affinity for lipopolysaccharide (LPS) endotoxins and are useful for removing such toxins from fluids, as antibacterial agents, eg active against Salmonella spp. and S. aureus, and for trachobronchial infections, urinary tract infections, bedsores, burns, complications.
                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                         (AAR75805) a small peptide isolated from japanese horseshoe crab haemocytes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungl, in particular for fungl pathogenic to plants e.g. Fusarium graminearum, Fusarium monilforme, Sclerotinia sclerotiorum, sclerotinia and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and
                                                                                                                                                                                                                                                                                                                                                                Gaps
                                New peptide derivs. of tachyplesin - having antimicrobial activity, used against plant pathogenic fungi or human or animal infections
                                                                                                            AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin
                                                                                                                                                                                                                                                                                                                                                              ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Length 17;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 1, Application US/08962034
Patent No. 6015941
GENERAL INFORMATION:
APPLICANT: RAO, A. GUTURAJ
TITLE OF INVENTION: PEPTIDE DERIVATIVES OF TACHYPLESIN
TITLE OF INVENTION: HAVING ANTIMICROBIAL ACTIVITY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      NUMBER OF SEQUENCES: 2
CORRESPONDENCE ADDRESS:
ADDRESSEE: Bell Seltzer IP Group of Alston & Bird
STREET: 3605 Glenwood Ave.
                MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: PATENTIN Release #1.0, Version #1.25
CURRENT APPLICATION DATA:
FILING DATE: US/08/426,550
FILING DATE: 21-APR-1995
CLASSIFICATION: 530
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          OPERATING SYSTEM: PC-DOS/MS-DOS

hypothetical protein At2938500 [imported] - Arabidopsis thaliana
NyAlternate names: hypothetical protein T19C21.1
C; Species: Arabidopsis thaliana (mouse-ear cress)
C; Date: 05-Mar-1999 #sequence_revision 05-Mar-1999 #text_change 16-Feb-2001
C; Accession: T02495; G84805

-!- FUNCTION: TYROSINE KINASE DOF THE NON-RECEPTOR TYPE, INVOLVED IN THE INTERLEUKIN-2 AND INTERLEUKIN-4 SIGNALING PATHWAY.

-!- CATALYTIC ACTIVITY: ATP + A PROTEIN TYROSINE = ADP + PROTEIN TYROSINE PHOSPHATE.

-!- CATALYTIC ACTIVITY: ATP + A PROTEIN TYROSINE = ADP + PROTEIN TYROSINE PHOSPHATE.

-!- SUBCELLUIAR LOCATION: WHOLLY INTRACELLULAR, POSSIBLY MEMBRANE ASSOCIATED (BY SIMILARITY).

-!- TISSUE SPECIFICITY: TRANSCRIBED IN A VARIETY OF TISSUES INCLUDING SPLEEN, LUNG, KINDRY AND INTESTINE PROBABLY CONTAINS: THE SECOND ONE PROBABLY CONTAINS THE CATALYTIC DOMAIN (BY SIMILARITY), WHILE THE PRESENCE OF SLIGHT DIFFERENCES SUGGEST A DIFFERENT ROLE FOR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       01-NOV-1997 (Rel. 35, Created)

analysis in severe combined immunodeficiency by single-strand
analysis in severe combined immunodeficiency by single-strand
thum. Genet. 106.73-79(2000):
C-i-FINCTION: TYROSINE KINASE OF THE NON-RECEPTOR TYPE, INVOLVED IN
THE INPERLEBININ-2 AND INTERLEBININ-4 SIGNALING PATHWAY.
PHOSPHORYLATES STAT6, IRS1, IRS2 AND P13K.
C-i-CATALYTIC ACTIVITY: ATP A PROTEIN TYROSINE - ADP +
PROTEIN TYROSINE PHOSPHATE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DOMAIN: POSSESSES TWO PHOSPHOTRANSFERASE DOMAINS. THE SECOND ONE PROBABLY CONTAINS THE CATALYTIC DOMAIN (BY SIMILARITY), WHILE THE PRESENCE OF SLIGHT DIFFERENCES SUGGEST A DIFFERENT ROLE FOR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           -i- SUBCELLULAR LOCATION: WHOLLY INTRACELLULAR, POSSIBLY MEMBRANE
ASSOCIATED (BY SIMILARITY)
-i- ALTERNATIVE PRODUCTS: THREE SPLICE VARIANTS WERE ISOLATED FROM
DIFFERENT MANA SOURCES: BREAST (JAK3B), SPLEEN (JAK3S; SHOWN
HERE), AND ACTIVATED MONOCYTES (JAK3M), JAK3B MAY BE DEFECTIVE
AS IT LACK SOME PART OF THE KINASE DOMAIN.
-i- TISSUE SPECIFICITY: IN NK CELLS AND AN NK-LIKE CELL LINE BUT NOT
IN RESTING T CELLS OR IN OTHER TISSUES. THE S-FORM IS MORE
COMMONIX SERN IN HEMATOPOLETIC LINES, WHERBAS THE B- AND M-FORMS
ARE DEFECTED IN CELLS BOTH OF HEMATOPOLETIC AND EPITHELIAL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Candotti F., Oakes S.A., Johnston J.A., Giliani S., Schumacher R.F., Mella P., Fiorini M., Ugazio A.G., Badolato R., Notarangelo L.D., Bozzi F., Macchi P., Strina D., Vezzoni P., Blaese R.M., O'Shea J.J.
